

## PLANTS OF NAVAJO NATIONAL MONUMENT

J. D. Brotherson,<sup>1</sup> G. Nebeker,<sup>2</sup>  
M. Skougaard,<sup>3</sup> and J. Fairchild<sup>1</sup>

**ABSTRACT.**—The floristic composition of Navajo National Monument is presented. The flora of the monument consists of 293 species of vascular plants, representing 177 genera and 66 families. The species are scattered throughout 12 plant communities found within the monument. The flora is dominated by forbs (60 percent), followed by shrubs (16 percent), grasses (12 percent) and trees (5 percent). Betatakin canyon exhibits the greatest floristic richness with 223 species being represented and 123 species found only in that area. This is due primarily to two factors: (1) the greater variety of habitats available in the area, and (2) the much longer time the area has been protected from grazing and other manmade disturbance.

Navajo National Monument is in northeastern Arizona about 10 miles north and west of Black Mesa and Arizona Highway 160. The park headquarters are located on the Shonto Plateau near the head of Betatakin Canyon, a small side canyon of Tsegi Canyon. The principle attractions of the monument are three large Indian "cliff dwellings" of the Anasazi culture. These cliff dwellings are located in three separate canyons. Betatakin and Keet Seel canyons are located in the Tsegi Canyon complex, while Inscription House is situated about 20 miles west of Betatakin in Nitsin Canyon, a branch of Navajo Canyon.

All three units lie in pinyon-juniper slick-rock country which tends to influence heavily the environment of the monument. In the region are many deep-cut canyons with high-walled sandstone cliffs often reaching heights of 1000 feet above the streambeds. Within these deep canyons and along their walls, water (in the form of springs and seeps) is often present, creating unique habitats in which develop plant and animal communities often foreign to the overall pinyon-juniper type.

Because of the historical background of the park, almost all previous studies conducted at Navajo National Monument have been archaeological in nature. Dean (1969) points out that up to that time no botanical studies of Tsegi Canyon and its environs had been completed. Apparently, he was referring to the vascular flora, since Flowers

(1963) published a study on the lichens and mosses of Betatakin Canyon and vicinity. In his introduction, Flowers (1963) briefly lists some of the dominant plant species in and around Betatakin Canyon. Woodbury (1963) at the request of the National Park Service studied the features of Betatakin Canyon and vicinity for their interpretative value and use by the park personnel. His treatment is cursory and brief.

### CLIMATE

Climatically, Navajo National Monument lies within the northeast sector of Arizona (Sellers 1964). There is a weather station at the park headquarters. Temperature and precipitation data for this station have appeared in *Climatological Data*, Arizona (U.S. Dept. of Commerce), since 1939.

The average annual temperature at Navajo National Monument headquarters is 50 F. The yearly maximum temperatures range from 94 to 101 F with an average of 96.1 F. The yearly low temperatures range from -10 to +8 F with an average of 1 F. The frost-free season ranges from 107 to 213 days with an average of 155 days.

The total annual precipitation at Betatakin has historically ranged from a low of 6.84 inches to a high of 18.79 inches with an average of 11.39 inches. The period of greatest precipitation is late summer and early fall. Rainfall within the canyons is variable and spotty, with localized

cloudbursts occurring more often than general rains.

### GEOLOGY

The geology of Tsegi Canyon has been treated by a number of authors (Gregory 1916, 1917; Hack 1942, 1945; Harshbarger, Repenning, and Irwin 1957; Cooley 1958, 1962). Navajo Sandstone is the major geological formation in each of the three localities. At Keet Seel and Inscription House the Navajo Sandstone is the only exposed rock formation. At Betatakin the Kayenta formation outcrops beneath the Navajo formation and can be observed in some locations in the lower reaches of the canyon. In all three canyons the Navajo Sandstone forms tall, rather sheer cliffs, up to 700 feet in height. At the base of these cliffs in each canyon, talus accumulations can be found, while the canyon bottoms are filled with deep deposits of sandy alluvium (quaternary fill). In Keet Seel and Nitsin Canyons these alluvial deposits are deeply eroded. In Betatakin Canyon the alluvial deposits are less extensive and not nearly so thick. They are underlain by the Kayenta formation in the lower half of the canyon and are deeply eroded, as is more characteristic of the canyon floor throughout the Tsegi Canyon system.

TABLE 1. Vegetative communities (associations) encountered within the boundaries of Navajo National Monument and the percent of area they occupy.

Vegetation type	Monument segment		
	Inscription House	Keet Seel	Batatakin
	Percent of area covered	Percent of area covered	Percent of area covered
Streamside-tree	1.8		
Slickrock-scattered shrub	35.0	12.6	
Atriplex-grass	25.9	0.2	
Talus slope	11.3	9.3	
Mixed weed		13.5	
Pinyon-juniper-mixed shrub	26.0	59.6	43.5
Oak		4.8	2.4
Hanging garden		**T	T
Pinyon-juniper-sage			49.9
Pinyon-juniper-grass			3.1
Douglas Fir			0.4
Aspen			.7

\*Total acreage equals:

Inscription House = 40  
Keet Seel = 40  
Batatakin = 452

\*\*T = trace

### PLANT COMMUNITIES

In line with the unique geological and habitat features of Navajo National Monument, the communities within its boundaries are varied and in some cases unique. Twelve community (association) types (Table 1) are encountered within the monument. Of these only one (Pinyon-Juniper mixed shrub) is found in all segments of the monument. Five of the remaining 11 community types are found in 2 of the monument areas while 6 of the types are restricted to a single segment.

Because of the uniqueness of the Betatakin Canyon area, the vegetation there is highly different and distinct when compared with adjacent Tsegi Canyon and surrounding areas. Of special note is the presence in the canyon of a complex of species (i.e., *Populus tremuloides*, *Pseudotsuga menziesii*, *Mahonia repens*, *Symphoricarpos vaccinoides*, etc.) more often associated with high mountain rather than desert habitat. These species are found in the canyon because of favorable moisture regimes created by the canyon geology and Navajo Sandstone hydrology.

### Flora of the Monument

The known flora of Navajo National Monument consists of 293 species of vascu-

lar plants, representing 177 genera and 66 families. Of these species, 73 percent belong to the plant families listed in Table 2. These figures indicate the relative plant family composition of the monument. When comparisons are made with other studies (Brotherson 1967, Campbell 1977, Allan 1977) done in somewhat comparable areas of the Great Basin (Table 2), 7 of the 17 plant families listed are found to be represented in the floras of all 4 locations. As can be seen from the table, Arches National Park (Allan 1977) is the most similar in its dominant family composition to that of Navajo National Monument, differing only in 5 of the 17 families listed. The studies done in the Uintah Basin and Kaiparowits areas show high degrees of similarity to each other, differing only in one major plant family as well as being dominated by 9 of the 17 plant families listed in the table. In light of these facts it is of interest to note that the Navajo National Monument and Arches National Park areas have as their major geological formations sandstone while the Kaiparowits and Uintah Basin study areas are underlain mainly by geological formations high in clay. The ecological and/or phytogeographical significance of the dominance of these 17 plant families and/or their relationship to the general ge-

ology of the area is not known; however, further investigation along such lines tends to hold interest.

The species richness of the different segments of the Navajo National Monument is shown in Table 3. As can be seen, the Betatakin area exhibits more than twice as many species in its vegetation as can be found in the other areas. It also contains the greatest number of species found in only one of the monument areas. This would primarily be due to two factors: (1) the much longer time the area has been protected from grazing and other man-made disturbance, and (2) the greater variety of habitats available in the area.

The life-form and/or growth habitat characteristics of the flora are summarized in Tables 4 and 5. Native species number 270, 92.2 percent of the total flora. Twenty-three species are introduced. These include such species as *Tamarix ramosissima*, *Elaeagnus angustifolia*, *Chenopodium album*, *Salsola iberica*, *Sisymbrium altissimum*, *Melilotus alba*, and other species of a weedy nature. The herbaceous types of growth habit account for almost 75 percent of the species, with shrubs and trees contributing together about 20 percent of the total. In area coverage, however, the tree-

TABLE 2. Dominant plant family composition of Navajo National Monument and other great basin sites.

Family	Navajo National Monument	Kaiparowits	Arches National Park	Uintah Basin

Salicaceae	2.0		1.7	
Total	73.2	75.1	71.5	72.7

and shrub-dominated vegetation types are the most widespread in the monument.

### Checklist

The present list of plant species is the result of specimen collection at Navajo National Monument that has extended over a period of more than 45 years. Personnel associated with the park service began collections during the late 1930s and early 1940s. Scientists from Brigham Young University began work in the monument in the summer of 1972. Since that time regular visits have been made to the area and collections have been made throughout the growing season.

TABLE 3. Floristic richness of the different segments of Navajo National Monument.

Area of Monument	No. of species	No. of species found only at area in question
Betatakin	223	123
Keet Seel	108	16
Inscription House	108	31

TABLE 4. Plant characteristics and generalized life forms of the flora of Navajo National Monument.

Category	No. of species in category	Percent of total
Total no. of species	293	100.0
Native species	270	92.2
Introduced species	23	7.8
Perennial species	224	76.5
Biennial species	21	7.2
Annual species	48	16.4

TABLE 5. Growth habit characteristics of the flora of Navajo National Monument.

Category	No. of species in category	Percent of total
Trees	14	4.8
Shrubs	49	16.7
Forbs	176	60.1
Grasses	37	12.6
Sedges	4	1.4
Vines	1	.3
Other	12	4.1

Over the years the area has been visited and collections made by: M. Wetherill, 1930-1938; J. W. Brewer, 1934-1947; S. P. Brewer, 1941; E. Lehnert, 1960; E. Jackson, 1961; W. S. Phillips, 1964; J. M. Rominger, 1965; M. Skougard and G. Nebeker, 1972-1973; J. Brotherson, 1972-1977; and J. Fairchild, 1977. In the following list the specimens upon which the species are based are designated and the collectors' names abbreviated as indicated below:

MW	M. Wetherill
JWB	J. W. Brewer
SPB	S. P. Brewer
EL	E. Lehnert
EJ	E. Jackson
WSP	W. S. Phillips
JMR	J. M. Rominger
SN	M. Skougard and G. Nebeker
JF	J. Fairchild
JDB	J. D. Brotherson

Each species entry is also designated as to certain plant characteristics and according to the section of the monument in which it was found growing. These abbreviations are as follows:

P	Perennial
B	Biennial
A	Annual
N	Native
I	Introduced
T	Tree
S	Shrub
F	Forb
G	Grass
GI	Sedge
NV	Non-vascular
V	Vine
b	Betatakin
k	Keet Seel
i	Inscription House

The following list of families, genera, and species is arranged in alphabetical order for ease of reference. Plant identification follows *Arizona Flora* (Kearney and Peebles 1960), *Seed Plants of Northern Arizona* (McDougal 1973), *Manual of the Plants of Colorado* (Harrington 1964) and *Utah Plants* (Welsh and Moore 1973).
